

## NAME

Pod::Simple::XMLOutputStream -- turn Pod into XML

## SYNOPSIS

```
perl -MPod::Simple::XMLOutputStream -e \  
    "exit Pod::Simple::XMLOutputStream->filter(shift)->any_errata_seen" \  
    thingy.pod
```

## DESCRIPTION

Pod::Simple::XMLOutputStream is a subclass of *Pod::Simple* that parses Pod and turns it into XML.

Pod::Simple::XMLOutputStream inherits methods from *Pod::Simple*.

## SEE ALSO

*Pod::Simple::DumpAsXML* is rather like this class; see its documentation for a discussion of the differences.

*Pod::Simple*, *Pod::Simple::DumpAsXML*, *Pod::SAX*

*Pod::Simple::Subclassing*

The older (and possibly obsolete) libraries *Pod::PXML*, *Pod::XML*

## ABOUT EXTENDING POD

TODO: An example or two of =extend, then point to Pod::Simple::Subclassing

## ASK ME!

If you actually want to use Pod as a format that you want to render to XML (particularly if to an XML instance with more elements than normal Pod has), please email me ([sburke@cpan.org](mailto:sburke@cpan.org)) and I'll probably have some recommendations.

For reasons of concision and energetic laziness, some methods and options in this module (and the dozen modules it depends on) are undocumented; but one of those undocumented bits might be just what you're looking for.
