

**NAME**

if - use a Perl module if a condition holds

**SYNOPSIS**

```
use if CONDITION, MODULE => ARGUMENTS;
```

**DESCRIPTION**

The construct

```
use if CONDITION, MODULE => ARGUMENTS;
```

has no effect unless `CONDITION` is true. In this case the effect is the same as of

```
use MODULE ARGUMENTS;
```

Above `=>` provides necessary quoting of `MODULE`. If not used (e.g., no `ARGUMENTS` to give), you'd better quote `MODULE` yourselves.

**BUGS**

The current implementation does not allow specification of the required version of the module.
